## Question 6.1:

Choose the correct answer. A thermodynamic state function is a quantity
(i) used to determine heat changes
(ii) whose value is independent of path
(iii) used to determine pressure volume work
(iv) whose value depends on temperature only.

Answer
A thermodynamic state function is a quantity whose value is independent of a path.
Functions like $p, V, T$ etc. depend only on the state of a system and not on the path. Hence, alternative (ii) is correct.

## Question 6.2:

For the process to occur under adiabatic conditions, the correct condition is:
(i) $\Delta T=0$
(ii) $\Delta p=0$
(iii) $q=0$
(iv) $w=0$

Answer
A system is said to be under adiabatic conditions if there is no exchange of heat between the system and its surroundings. Hence, under adiabatic conditions, $q=0$.
Therefore, alternative (iii) is correct.

## Question 6.3:

The enthalpies of all elements in their standard states are:
(i) unity
(ii) zero
(iii) < 0
(iv) different for each element

## Answer

The enthalpy of all elements in their standard state is zero.
Therefore, alternative (ii) is correct.

## Question 6.4:

$\Delta U^{\theta}$ of combustion of methane is $-X \mathrm{~kJ} \mathrm{~mol}^{-1}$. The value of $\Delta H^{\theta}$ is
(i) $=\Delta U^{\ominus}$
(ii) $>\Delta U^{\theta}$
(iii) $<\Delta U^{\theta}$
(iv) $=0$

Answer
Since $\Delta H^{\theta}=\Delta U^{\theta}+\Delta n_{g} R T$ and $\Delta U^{\theta}=-X \mathrm{~kJ} \mathrm{~mol}^{-1}$,
$\Delta H^{\theta}=(-X)+\Delta n_{g} R T$.
$\Rightarrow \Delta H^{\ominus}<\Delta U^{\ominus}$
Therefore, alternative (iii) is correct.

## Question 6.5:

The enthalpy of combustion of methane, graphite and dihydrogen at 298 K are, -890.3 $\mathrm{kJ} \mathrm{mol}{ }^{-1}-393.5 \mathrm{~kJ} \mathrm{~mol}^{-1}$, and $-285.8 \mathrm{~kJ} \mathrm{~mol}^{-1}$ respectively. Enthalpy of formation of $\mathrm{CH}_{4(\mathrm{~g})}$ will be
(i) $-74.8 \mathrm{~kJ} \mathrm{~mol}^{-1}$
(ii) $-52.27 \mathrm{~kJ} \mathrm{~mol}^{-1}$
(iii) $+74.8 \mathrm{~kJ} \mathrm{~mol}^{-1}$
(iv) $+52.26 \mathrm{~kJ} \mathrm{~mol}^{-1}$.

Answer
According to the question,
(i) $\quad \mathrm{CH}_{4(\mathrm{~g})}+2 \mathrm{O}_{2(\mathrm{~g})} \longrightarrow \mathrm{CO}_{2(\mathrm{~g})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$

$$
\Delta H=-890.3 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

(ii) $\mathrm{C}_{(s)}+\mathrm{O}_{2(\mathrm{~g})} \longrightarrow \mathrm{CO}_{2(\mathrm{~g})}$

$$
\Delta H=-393.5 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

(iii) $2 \mathrm{H}_{2(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})} \longrightarrow 2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$

$$
\Delta H=-285.8 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

Thus, the desired equation is the one that represents the formation of $\mathrm{CH}_{4}$ (g) i.e.,
$\mathrm{C}_{(\mathrm{s})}+2 \mathrm{H}_{2(\mathrm{~g})} \longrightarrow \mathrm{CH}_{4(\mathrm{~g})}$
$\Delta_{f} H_{\mathrm{CH}_{4}}=\Delta_{c} H_{\mathrm{c}}+2 \Delta_{c} H_{\mathrm{H}_{2}}-\Delta_{c} H_{\mathrm{CO}_{2}}$
$=[-393.5+2(-285.8)-(-890.3)] \mathrm{kJ} \mathrm{mol}^{-1}$
$=-74.8 \mathrm{~kJ} \mathrm{~mol}^{-1}$
$\therefore$ Enthalpy of formation of $\mathrm{CH}_{4(\mathrm{~g})}=-74.8 \mathrm{~kJ} \mathrm{~mol}^{-1}$
Hence, alternative (i) is correct.

## Question 6.6:

A reaction, $A+B \rightarrow C+D+q$ is found to have a positive entropy change. The reaction will be
(i) possible at high temperature
(ii) possible only at low temperature
(iii) not possible at any temperature
(iv) possible at any temperature

Answer
For a reaction to be spontaneous, $\Delta G$ should be negative.
$\Delta G=\Delta H-T \Delta S$
According to the question, for the given reaction,
$\Delta S=$ positive
$\Delta H=$ negative (since heat is evolved)
$\Rightarrow \Delta G=$ negative
Therefore, the reaction is spontaneous at any temperature.
Hence, alternative (iv) is correct.

## Question 6.7:

In a process, 701 J of heat is absorbed by a system and 394 J of work is done by the system. What is the change in internal energy for the process?

Answer
According to the first law of thermodynamics,
$\Delta U=q+W(i)$
Where,
$\Delta U=$ change in internal energy for a process
$q=$ heat
$W=$ work
Given,
$q=+701 \mathrm{~J}$ (Since heat is absorbed)
$W=-394 \mathrm{~J}$ (Since work is done by the system)

Substituting the values in expression (i), we get
$\Delta U=701 \mathrm{~J}+(-394 \mathrm{~J})$
$\Delta U=307 \mathrm{~J}$
Hence, the change in internal energy for the given process is 307 J .

## Question 6.8:

The reaction of cyanamide, $\mathrm{NH}_{2} \mathrm{CN}_{(s)}$, with dioxygen was carried out in a bomb calorimeter, and $\Delta U$ was found to be $-742.7 \mathrm{~kJ} \mathrm{~mol}^{-1}$ at 298 K . Calculate enthalpy change for the reaction at 298 K .
$\mathrm{NH}_{2} \mathrm{CN}_{(\mathrm{g})}+\frac{3}{2} \mathrm{O}_{2(\mathrm{~g})} \longrightarrow \mathrm{N}_{2(\mathrm{~g})}+\mathrm{CO}_{2(\mathrm{~g})}+\mathrm{H}_{2} \mathrm{O}_{(l)}$
Answer
Enthalpy change for a reaction $(\Delta H)$ is given by the expression,
$\Delta H=\Delta U+\Delta n_{g} R T$
Where,
$\Delta U=$ change in internal energy
$\Delta n_{g}=$ change in number of moles
For the given reaction,
$\Delta n_{g}=\Sigma n_{g}$ (products) $-\sum n_{g}$ (reactants)
$=(2-2.5)$ moles
$\Delta n_{g}=-0.5$ moles
And,
$\Delta U=-742.7 \mathrm{~kJ} \mathrm{~mol}^{-1}$
$T=298 \mathrm{~K}$
$\mathrm{R}=8.314 \times 10^{-3} \mathrm{~kJ} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
Substituting the values in the expression of $\Delta H$ :
$\Delta H=\left(-742.7 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)+(-0.5 \mathrm{~mol})(298 \mathrm{~K})\left(8.314 \times 10^{-3} \mathrm{~kJ} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right)$
$=-742.7-1.2$
$\Delta H=-743.9 \mathrm{~kJ} \mathrm{~mol}^{-1}$

## Question 6.9:

Calculate the number of kJ of heat necessary to raise the temperature of 60.0 g of aluminium from $35^{\circ} \mathrm{C}$ to $55^{\circ} \mathrm{C}$. Molar heat capacity of Al is $24 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$.

Answer
From the expression of heat $(q)$,
$q=m . c . \Delta T$
Where,
$\mathrm{c}=$ molar heat capacity
$m=$ mass of substance
$\Delta T=$ change in temperature
Substituting the values in the expression of $q$ :
$q=\left(\frac{60}{27} \mathrm{~mol}\right)\left(24 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right)(20 \mathrm{~K})$
$q=1066.7 \mathrm{~J}$
$q=1.07 \mathrm{~kJ}$

## Question 6.10:

Calculate the enthalpy change on freezing of 1.0 mol of water at $10.0^{\circ} \mathrm{C}$ to ice at $10.0^{\circ} \mathrm{C} . \Delta_{\text {fus }} \mathrm{H}=6.03 \mathrm{~kJ} \mathrm{~mol}^{-1}$ at $0^{\circ} \mathrm{C}$.
$C_{p}\left[\mathrm{H}_{2} \mathrm{O}(\mathrm{I})\right]=75.3 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
$C_{p}\left[\mathrm{H}_{2} \mathrm{O}(\mathrm{s})\right]=36.8 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
Answer
Total enthalpy change involved in the transformation is the sum of the following changes:
(a) Energy change involved in the transformation of 1 mol of water at $10^{\circ} \mathrm{C}$ to 1 mol of water at $0^{\circ} \mathrm{C}$.
(b) Energy change involved in the transformation of 1 mol of water at $0^{\circ}$ to 1 mol of ice at $0^{\circ} \mathrm{C}$.
(c) Energy change involved in the transformation of 1 mol of ice at $0^{\circ} \mathrm{C}$ to 1 mol of ice at $-10^{\circ} \mathrm{C}$.
Total $\Delta \mathrm{H}=C_{p}\left[\mathrm{H}_{2} \mathrm{OCl}\right] \Delta T+\Delta H_{\text {freezing }}+C_{p}\left[\mathrm{H}_{2} \mathrm{O}_{(s)}\right] \Delta T$
$=\left(75.3 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right)(0-10) \mathrm{K}+\left(-6.03 \times 10^{3} \mathrm{~J} \mathrm{~mol}^{-1}\right)+\left(36.8 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right)(-10-0) \mathrm{K}$
$=-753 \mathrm{~J} \mathrm{~mol}^{-1}-6030 \mathrm{~J} \mathrm{~mol}^{-1}-368 \mathrm{~J} \mathrm{~mol}^{-1}$
$=-7151 \mathrm{~J} \mathrm{~mol}^{-1}$
$=-7.151 \mathrm{~kJ} \mathrm{~mol}^{-1}$

Hence, the enthalpy change involved in the transformation is $-7.151 \mathrm{~kJ} \mathrm{~mol}^{-1}$.

## Question 6.11:

Enthalpy of combustion of carbon to $\mathrm{CO}_{2}$ is $-393.5 \mathrm{~kJ} \mathrm{~mol}^{-1}$. Calculate the heat released upon formation of 35.2 g of $\mathrm{CO}_{2}$ from carbon and dioxygen gas.
Answer
Formation of $\mathrm{CO}_{2}$ from carbon and dioxygen gas can be represented as:

$$
\mathrm{C}_{(s)}+\mathrm{O}_{2(g)} \longrightarrow \mathrm{CO}_{2(g)} \quad \Delta_{f} H=-393.5 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

$(1 \mathrm{~mole}=44 \mathrm{~g})$
Heat released on formation of $44 \mathrm{~g} \mathrm{CO}_{2}=-393.5 \mathrm{~kJ} \mathrm{~mol}^{-1}$
$\therefore$ Heat released on formation of $35.2 \mathrm{~g} \mathrm{CO}_{2}$
$=\frac{-393.5 \mathrm{~kJ} \mathrm{~mol}^{-1}}{44 \mathrm{~g}} \times 35.2 \mathrm{~g}$
$=-314.8 \mathrm{~kJ} \mathrm{~mol}^{-1}$

## Question 6.12:

Enthalpies of formation of $\mathrm{CO}_{(g)}, \mathrm{CO}_{2(g)}, \mathrm{N}_{2} \mathrm{O}_{(g)}$ and $\mathrm{N}_{2} \mathrm{O}_{4(g)}$ are $-110 \mathrm{~kJ} \mathrm{~mol}^{-1}$, - 393 kJ $\mathrm{mol}^{-1}, 81 \mathrm{~kJ} \mathrm{~mol}^{-1}$ and $9.7 \mathrm{~kJ} \mathrm{~mol}^{-1}$ respectively. Find the value of $\Delta_{r} H$ for the reaction:
$\mathrm{N}_{2} \mathrm{O}_{4(g)}+3 \mathrm{CO}_{(g)} \longrightarrow \mathrm{N}_{2} \mathrm{O}_{(g)}+3 \mathrm{CO}_{2(g)}$
Answer
$\Delta_{r} H$ for a reaction is defined as the difference between $\Delta_{f} H$ value of products and $\Delta_{f} H$ value of reactants.

$$
\Delta_{r} H=\sum \Delta_{f} H \text { (products) }-\sum \Delta_{f} H \text { (reactants) }
$$

For the given reaction,

$$
\begin{aligned}
& \mathrm{N}_{2} \mathrm{O}_{4(g)}+3 \mathrm{CO}_{(g)} \longrightarrow \mathrm{N}_{2} \mathrm{O}_{(g)}+3 \mathrm{CO}_{2(g)} \\
& \Delta_{r} H=\left[\left\{\Delta_{f} H\left(\mathrm{~N}_{2} \mathrm{O}\right)+3 \Delta_{f} H\left(\mathrm{CO}_{2}\right)\right\}-\left\{\Delta_{f} H\left(\mathrm{~N}_{2} \mathrm{O}_{4}\right)+3 \Delta_{f} H(\mathrm{CO})\right\}\right]
\end{aligned}
$$

Substituting the values of $\Delta_{f} H$ for $\mathrm{N}_{2} \mathrm{O}, \mathrm{CO}_{2}, \mathrm{~N}_{2} \mathrm{O}_{4}$, and CO from the question, we get:

$$
\begin{aligned}
& \Delta_{r} H=\left[\left\{81 \mathrm{~kJ} \mathrm{~mol}^{-1}+3(-393) \mathrm{kJ} \mathrm{~mol}^{-1}\right\}-\left\{9.7 \mathrm{~kJ} \mathrm{~mol}^{-1}+3(-110) \mathrm{kJ} \mathrm{~mol}^{-1}\right\}\right] \\
& \Delta_{r} H=-777.7 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{aligned}
$$

Hence, the value of $\Delta_{r} H$ for the reaction is $-777.7 \mathrm{~kJ} \mathrm{~mol}^{-1}$.

## Question 6.13:

Given

$$
\mathrm{N}_{2(\mathrm{~g})}+3 \mathrm{H}_{2(\mathrm{~g})} \longrightarrow 2 \mathrm{NH}_{3(\mathrm{~g})} ; \Delta_{r} H^{\theta}=-92.4 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

What is the standard enthalpy of formation of $\mathrm{NH}_{3}$ gas?

## Answer

Standard enthalpy of formation of a compound is the change in enthalpy that takes place during the formation of 1 mole of a substance in its standard form from its constituent elements in their standard state.
Re-writing the given equation for 1 mole of $\mathrm{NH}_{3(\mathrm{~g})}$,
$\frac{1}{2} \mathrm{~N}_{2(\mathrm{~g})}+\frac{3}{2} \mathrm{H}_{2(\mathrm{~g})} \longrightarrow \mathrm{NH}_{3(\mathrm{~g})}$
$\therefore$ Standard enthalpy of formation of $\mathrm{NH}_{3(\mathrm{~g})}$
$=1 / 2 \Delta_{r} H^{\theta}$
$=1 / 2\left(-92.4 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)$
$=-46.2 \mathrm{~kJ} \mathrm{~mol}^{-1}$

## Question 6.14:

Calculate the standard enthalpy of formation of $\mathrm{CH}_{3} \mathrm{OH}_{(I)}$ from the following data:
$\mathrm{CH}_{3} \mathrm{OH}_{(I)}+\frac{3}{2} \mathrm{O}_{2(g)} \longrightarrow \mathrm{CO}_{2(g)}+2 \mathrm{H}_{2} \mathrm{O}_{(I)} ; \Delta_{r} H^{\theta}=-726 \mathrm{~kJ} \mathrm{~mol}^{-1}$
$\mathrm{C}_{(g)}+\mathrm{O}_{2(g)} \longrightarrow \mathrm{CO}_{2(g)} ; \Delta_{c} H^{\theta}=-393 \mathrm{~kJ} \mathrm{~mol}^{-1}$
$\mathrm{H}_{2(g)}+\frac{\frac{1}{2}}{\mathrm{O}_{2(g)}} \longrightarrow \mathrm{H}_{2} \mathrm{O}_{(I)} ; \Delta_{f} H^{\theta}=-286 \mathrm{~kJ} \mathrm{~mol}^{-1}$.
Answer
The reaction that takes place during the formation of $\mathrm{CH}_{3} \mathrm{OH}_{(I)}$ can be written as:
$\mathrm{C}_{(s)}+2 \mathrm{H}_{2} \mathrm{O}_{(g)}+\frac{1}{2} \mathrm{O}_{2(g)} \longrightarrow \mathrm{CH}_{3} \mathrm{OH}_{(l)}$
The reaction (1) can be obtained from the given reactions by following the algebraic calculations as:
Equation (ii) $+2 \times$ equation (iii) - equation (i)
$\Delta_{f} H^{\theta}\left[\mathrm{CH}_{3} \mathrm{OH}_{(I)}\right]=\Delta_{\mathrm{c}} H^{\theta}+2 \Delta_{f} H^{\theta}\left[\mathrm{H}_{2} \mathrm{O}_{(I)}\right]-\Delta_{r} H^{\theta}$
$=\left(-393 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)+2\left(-286 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)-\left(-726 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)$
$=(-393-572+726) \mathrm{kJ} \mathrm{mol}^{-1}$
$\therefore \Delta_{f} H^{\theta}\left[\mathrm{CH}_{3} \mathrm{OH}_{(I)}\right]=-239 \mathrm{~kJ} \mathrm{~mol}^{-1}$

## Question 6.15:

Calculate the enthalpy change for the process

$$
\mathrm{CCl}_{4(g)} \rightarrow \mathrm{C}_{(g)}+4 \mathrm{Cl}_{(g)}
$$

and calculate bond enthalpy of $\mathrm{C}-\mathrm{Cl}$ in $\mathrm{CCl}_{4(g)}$.
$\Delta_{\text {vap }} H^{\theta}\left(\mathrm{CCl}_{4}\right)=30.5 \mathrm{~kJ} \mathrm{~mol}^{-1}$.
$\Delta_{f} H^{\theta}\left(\mathrm{CCl}_{4}\right)=-135.5 \mathrm{~kJ} \mathrm{~mol}^{-1}$.
$\Delta_{a} H^{\theta}(\mathrm{C})=715.0 \mathrm{~kJ} \mathrm{~mol}^{-1}$, where $\Delta_{a} H^{\theta}$ is enthalpy of atomisation
$\Delta_{a} H^{\theta}\left(\mathrm{Cl}_{2}\right)=242 \mathrm{~kJ} \mathrm{~mol}^{-1}$
Answer
The chemical equations implying to the given values of enthalpies are:

$$
\begin{equation*}
\mathrm{CCl}_{4(l)} \longrightarrow \mathrm{CCl}_{4(\mathrm{~s})} \Delta_{\text {vap }} H^{\theta}=30.5 \mathrm{~kJ} \mathrm{~mol}^{-1} \tag{i}
\end{equation*}
$$

(ii) $\quad \mathrm{C}_{(s)} \longrightarrow \mathrm{C}_{(g)} \Delta_{a} H^{\theta}=715.0 \mathrm{~kJ} \mathrm{~mol}^{-1}$
(iii) $\quad \mathrm{Cl}_{2(g)} \longrightarrow 2 \mathrm{Cl}_{(\mathrm{g})} \Delta_{a} H^{\theta}=242 \mathrm{~kJ} \mathrm{~mol}^{-1}$
(iv) $\mathrm{C}_{(g)}+4 \mathrm{Cl}_{(g)} \longrightarrow \mathrm{CCl}_{4(\mathrm{~g})} \Delta_{f} H=-135.5 \mathrm{~kJ} \mathrm{~mol}^{-1}$

Enthalpy change for the given process $\mathrm{CCl}_{4(g)} \longrightarrow \mathrm{C}_{(g)}+4 \mathrm{Cl}_{(g)}$, can be calculated using the following algebraic calculations as:
Equation (ii) $+2 \times$ Equation (iii) - Equation (i) - Equation (iv)
$\Delta H=\Delta_{a} H^{\theta}(\mathrm{C})+2 \Delta_{a} H^{\theta}\left(\mathrm{Cl}_{2}\right)-\Delta_{\text {vap }} H^{\theta}-\Delta_{f} H$
$=\left(715.0 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)+2\left(242 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)-\left(30.5 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)-\left(-135.5 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)$
$\therefore \Delta H=1304 \mathrm{~kJ} \mathrm{~mol}^{-1}$
Bond enthalpy of $\mathrm{C}-\mathrm{Cl}$ bond in $\mathrm{CCl}_{4(\mathrm{~g})}$
$=\frac{1304}{4} \mathrm{~kJ} \mathrm{~mol}^{-1}$
$=326 \mathrm{~kJ} \mathrm{~mol}^{-1}$

## Question 6.16:

For an isolated system, $\Delta U=0$, what will be $\Delta S$ ?
Answer
$\Delta S$ will be positive i.e., greater than zero
Since $\Delta U=0, \Delta S$ will be positive and the reaction will be spontaneous.

## Question 6.17:

For the reaction at 298 K,
$2 A+B \rightarrow C$
$\Delta H=400 \mathrm{~kJ} \mathrm{~mol}^{-1}$ and $\Delta S=0.2 \mathrm{~kJ} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$
At what temperature will the reaction become spontaneous considering $\Delta H$ and $\Delta S$ to be constant over the temperature range?

Answer
From the expression,
$\Delta G=\Delta H-T \Delta S$
Assuming the reaction at equilibrium, $\Delta T$ for the reaction would be:

$$
\begin{aligned}
& T=(\Delta H-\Delta G) \frac{1}{\Delta S} \\
& =\frac{\Delta H}{\Delta S}(\Delta G=0 \text { at equilibrium }) \\
& =\frac{400 \mathrm{~kJ} \mathrm{~mol}^{-1}}{0.2 \mathrm{~kJ} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}} \\
& T=2000 \mathrm{~K}
\end{aligned}
$$

For the reaction to be spontaneous, $\Delta G$ must be negative. Hence, for the given reaction to be spontaneous, $T$ should be greater than 2000 K .

## Question 6.18:

For the reaction,
$2 \mathrm{Cl}_{(g)} \rightarrow \mathrm{Cl}_{2(g)}$, what are the signs of $\Delta H$ and $\Delta S$ ?
Answer
$\Delta H$ and $\Delta S$ are negative

The given reaction represents the formation of chlorine molecule from chlorine atoms. Here, bond formation is taking place. Therefore, energy is being released. Hence, $\Delta H$ is negative.

Also, two moles of atoms have more randomness than one mole of a molecule. Since spontaneity is decreased, $\Delta S$ is negative for the given reaction.

## Question 6.19:

For the reaction
$2 \mathrm{~A}_{(g)}+\mathrm{B}_{(g)} \rightarrow 2 \mathrm{D}_{(g)}$
$\Delta U^{\ominus}=-10.5 \mathrm{~kJ}$ and $\Delta S^{\ominus}=-44.1 \mathrm{JK}^{-1}$.
Calculate $\Delta G^{\ominus}$ for the reaction, and predict whether the reaction may occur spontaneously.
Answer
For the given reaction,
$2 \mathrm{~A}_{(g)}+\mathrm{B}_{(g)} \rightarrow 2 \mathrm{D}_{(g)}$
$\Delta n_{g}=2$ - (3)
$=-1 \mathrm{~mole}$
Substituting the value of $\Delta U^{\theta}$ in the expression of $\Delta H$ :
$\Delta H^{\theta}=\Delta U^{\theta}+\Delta n_{g} R T$
$=(-10.5 \mathrm{~kJ})-(-1)\left(8.314 \times 10^{-3} \mathrm{~kJ} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right)(298 \mathrm{~K})$
$=-10.5 \mathrm{~kJ}-2.48 \mathrm{~kJ}$
$\Delta H^{\theta}=-12.98 \mathrm{~kJ}$
Substituting the values of $\Delta H^{\theta}$ and $\Delta S^{\theta}$ in the expression of $\Delta G^{\theta}$ :
$\Delta G^{\ominus}=\Delta H^{\ominus}-T \Delta S^{\ominus}$
$=-12.98 \mathrm{~kJ}-(298 \mathrm{~K})\left(-44.1 \mathrm{~J} \mathrm{~K}^{-1}\right)$
$=-12.98 \mathrm{~kJ}+13.14 \mathrm{~kJ}$
$\Delta G^{\ominus}=+0.16 \mathrm{~kJ}$
Since $\Delta G^{\ominus}$ for the reaction is positive, the reaction will not occur spontaneously.

## Question 6.20:

The equilibrium constant for a reaction is 10 . What will be the value of $\Delta G^{\theta} ? \mathrm{R}=8.314$ $\mathrm{JK}^{-1} \mathrm{~mol}^{-1}, T=300 \mathrm{~K}$.
Answer

From the expression,
$\Delta G^{\theta}=-2.303 R T \log K_{e q}$
$\Delta G^{\theta}$ for the reaction,
$=(2.303)\left(8.314 \mathrm{JK}^{-1} \mathrm{~mol}^{-1}\right)(300 \mathrm{~K}) \log 10$
$=-5744.14 \mathrm{Jmol}^{-1}$
$=-5.744 \mathrm{~kJ} \mathrm{~mol}^{-1}$

## Question 6.21:

Comment on the thermodynamic stability of $\mathrm{NO}_{(g)}$, given
$\frac{1}{2} \mathrm{~N}_{2(g)}+\frac{\frac{1}{2}}{\mathrm{O}_{2(g)} \rightarrow \mathrm{NO}_{(g)}} ; \Delta_{r} H^{\theta}=90 \mathrm{~kJ} \mathrm{~mol}^{-1}$
$\mathrm{NO}_{(g)}+\frac{\frac{1}{2}}{2} \mathrm{O}_{2(g)} \rightarrow \mathrm{NO}_{2(g)}: \Delta_{r} H^{\theta}=-74 \mathrm{~kJ} \mathrm{~mol}^{-1}$
Answer
The positive value of $\Delta_{r} H$ indicates that heat is absorbed during the formation of $\mathrm{NO}_{(g)}$.
This means that $\mathrm{NO}_{(g)}$ has higher energy than the reactants $\left(\mathrm{N}_{2}\right.$ and $\mathrm{O}_{2}$ ). Hence, $\mathrm{NO}_{(g)}$ is unstable.

The negative value of $\Delta_{r} H$ indicates that heat is evolved during the formation of $\mathrm{NO}_{2(g)}$ from $\mathrm{NO}_{(g)}$ and $\mathrm{O}_{2(g)}$. The product, $\mathrm{NO}_{2(g)}$ is stabilized with minimum energy.

Hence, unstable $\mathrm{NO}_{(g)}$ changes to unstable $\mathrm{NO}_{2(g)}$.

## Question 6.22:

Calculate the entropy change in surroundings when 1.00 mol of $\mathrm{H}_{2} \mathrm{O}_{(I)}$ is formed under standard conditions. $\Delta_{f} H^{\theta}=-286 \mathrm{~kJ} \mathrm{~mol}^{-1}$.

Answer
It is given that $286 \mathrm{~kJ} \mathrm{~mol}^{-1}$ of heat is evolved on the formation of $1 \mathrm{~mol}^{\mathrm{mof}} \mathrm{H}_{2} \mathrm{O}_{(l)}$. Thus, an equal amount of heat will be absorbed by the surroundings.
$q_{\text {surr }}=+286 \mathrm{~kJ} \mathrm{~mol}^{-1}$
Entropy change $\left(\Delta S_{\text {surr }}\right)$ for the surroundings $=\frac{q_{\text {surr }}}{7}$
$=\frac{286 \mathrm{~kJ} \mathrm{~mol}^{-1}}{298 \mathrm{k}}$
$\therefore \Delta S_{\text {surr }}=959.73 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
