Middle Term.

The middle term depends upon the value of n.

(1) **When n is even,** then total number of terms in the expansion of $(x+y)^n$ is $n+1$ (odd). So there is only one middle term i.e., $\left(\dfrac{n}{2}+1\right)^{th}$ term is the middle term. $T_{\left[\frac{n}{2}+1\right]} = {}^nC_{n/2}x^{n/2}y^{n/2}$

(2) **When n is odd**, then total number of terms in the expansion of $(x+y)^n$ is $n+1$ (even). So, there are two middle terms i.e., $\left(\dfrac{n+1}{2}\right)^{th}$ and $\left(\dfrac{n+3}{2}\right)^{th}$ are two middle terms.

$$T_{\left(\frac{n+1}{2}\right)} = {}^nC_{\frac{n-1}{2}}x^{\frac{n+1}{2}}y^{\frac{n-1}{2}} \text{ and } T_{\left(\frac{n+3}{2}\right)} = {}^nC_{\frac{n+1}{2}}x^{\frac{n-1}{2}}y^{\frac{n+1}{2}}$$

Note: When there are two middle terms in the expansion then their binomial coefficients are equal.

Binomial coefficient of middle term is the greatest binomial coefficient.
