## Mayer's Formula.

Out of two principle specific heats of a gas, Cp is more than Cv because in case of Cv , volume of gas is kept constant and heat is required only for raising the temperature of one gram mole of the gas through $1^{\circ} \mathrm{C}$ or 1 K .

No heat, what so ever, is spent in expansion of the gas.
It means that heat supplied to the gas increases its internal energy only i.e.

$$
\begin{equation*}
(\Delta Q)_{v}=\Delta U=\mu C_{v} \Delta T \tag{i}
\end{equation*}
$$

While in case of Cp the heat is used in two ways
(i) In increasing the temperature of the gas by $\Delta T$
(ii) In doing work, due to expansion at constant pressure ( $\Delta \mathrm{W}$ )

So

$$
\begin{equation*}
(\Delta Q)_{p}=\Delta U+\Delta W=\mu C_{p} \Delta T \tag{ii}
\end{equation*}
$$

From equation (i) and (ii) $\mu C_{p} \Delta T-\mu C_{v} \Delta T=\Delta W$

$$
\begin{array}{lll}
\Rightarrow & \mu \Delta T\left(C_{p}-C_{v}\right)=P \Delta V & \text { [For constant } \mathrm{P}, \Delta \mathrm{~W}=\mathrm{P} \Delta \mathrm{~V} \text { ] } \\
\Rightarrow & C_{p}-C_{v}=\frac{P \Delta V}{\mu \Delta T} & {[\text { From PV }=\mu \mathrm{RT}, \text { At }}
\end{array}
$$

$\mu \mathrm{R} \Delta \mathrm{T}]$

$$
\Rightarrow \quad C_{p}-C_{v}=R
$$

This relation is called Mayer's formula and shows that $C_{p}>C_{v}$ i.e. molar specific heat at constant pressure is greater than that at constant volume.
