

Reference Guide & Formula Sheet for Physics

#3 Components of a Vector
 if $V = 34 \text{ m/sec}$ 48°
 then
 $V_i = 34 \text{ m/sec} \cdot (\cos 48^\circ)$; and $V_j = 34 \text{ m/sec} \cdot (\sin 48^\circ)$

#4 Weight = $m \cdot g$
 $g = 9.81 \text{ m/sec}^2$ near the surface of the Earth
 $= 9.795 \text{ m/sec}^2$ in Fort Worth, TX

Density = mass / volume
 $\rho = \frac{m}{V} \text{ unit : kg / m}^3$

#7 Ave speed = distance / time = $v = d/t$
Ave velocity = displacement / time = $v = d/t$
Ave acceleration = change in velocity / time

#8 Friction Force
 $F_f = \mu \cdot F_N$
 If the object is not moving, you are dealing with static friction and it can have any value from zero up to $\mu_s F_N$
 If the object is sliding, then you are dealing with kinetic friction and it will be constant and equal to $\mu_k F_N$

#9 Torque
 $\tau = F \cdot L \cdot \sin \theta$
 Where θ is the angle between F and L ; unit: Nm

#11 Newton's Second Law
 $F_{\text{net}} = \Sigma F_{\text{Ext}} = m \cdot a$

#12 Work = $F \cdot D \cdot \cos \theta$
 Where D is the distance moved and θ is the angle between F and the direction of motion, unit : J

#16 Power = rate of work done
 $Power = \frac{Work}{time}$ unit : watt

Efficiency = $Work_{\text{out}} / Energy_{\text{in}}$
Mechanical Advantage = force out / force in
 $M.A. = F_{\text{out}} / F_{\text{in}}$

#19 Constant-Acceleration Linear Motion
 $v = v_i + a \cdot t$ x
 $(x - x_i) = v_i \cdot t + \frac{1}{2} \cdot a \cdot t^2$ v
 $v^2 = v_i^2 + 2 \cdot a \cdot (x - x_i)$ t
 $(x - x_i) = \frac{1}{2} \cdot (v_i + v) \cdot t$ a
 $(x - x_i) = v \cdot t - \frac{1}{2} \cdot a \cdot t^2$ v_f

#20 Heating a Solid, Liquid or Gas
 $Q = m \cdot c \cdot \Delta T$ (no phase changes!)
 $Q =$ the heat added
 $c =$ specific heat.
 $\Delta T =$ temperature change, K

#21 Linear Momentum
 momentum = $p = m \cdot v = \text{mass} \cdot \text{velocity}$
 momentum is conserved in collisions

#23 Center of Mass – point masses on a line
 $x_{\text{cm}} = \frac{\Sigma (m_i x_i)}{M_{\text{total}}}$

#25 Angular Speed vs. Linear Speed
 Linear speed = $v = r \cdot \omega = r \cdot \text{angular speed}$

#26 Pressure under Water
 $P = \rho \cdot g \cdot h$
 $h =$ depth of water
 $\rho =$ density of water

#28 Universal Gravitation
 $F = G \frac{m_1 m_2}{r^2}$
 $G = 6.67 \text{ E-11 N m}^2 / \text{kg}^2$

#29 Mechanical Energy
 $PE_{\text{Grav}} = P = m \cdot g \cdot h$
 $KE_{\text{Linear}} = K = \frac{1}{2} \cdot m \cdot v^2$

#30 Impulse = Change in Momentum
 $F \cdot \Delta t = \Delta (m \cdot v)$

#31 Snell's Law
 $n_1 \cdot \sin \theta_1 = n_2 \cdot \sin \theta_2$
 n_2 Index of Refraction
 $n = c / v$
 $c =$ speed of light = 3 E+8 m/s

#32 Ideal Gas Law
 $P \cdot V = n \cdot R \cdot T$
 $n =$ # of moles of gas
 $R =$ gas law constant = 8.31 J / K mole .

#34 Periodic Waves
 $v = f \cdot \lambda$
 $f = 1 / T$ $T =$ period of wave

#35 Constant-Acceleration Circular Motion
 $v = v_i + \omega \cdot t$ θ
 $\Delta \theta = \omega \cdot t + \frac{1}{2} \cdot \alpha \cdot t^2$ θ
 $v^2 = v_i^2 + 2 \cdot \alpha \cdot (\Delta \theta)$ t
 $\Delta \theta = \frac{1}{2} \cdot (\omega_i + \omega) \cdot t$ α
 $\Delta \theta = \omega \cdot t - \frac{1}{2} \cdot \alpha \cdot t^2$ θ

Reference Guide & Formula Sheet for Physics

- #36 Buoyant Force - Buoyancy**
 $F_B = \rho \cdot V \cdot g = m_{\text{Displaced fluid}} \cdot g = \text{weight}_{\text{Displaced fluid}}$
 $\rho = \text{density of the fluid}$
 $V = \text{volume of fluid displaced}$

Reference Guide & Formula Sheet for Physics

#63 Period of Simple Harmonic Motion

$$T = 2\pi \sqrt{\frac{m}{k}} \quad \text{where } k = \text{spring constant}$$

$$f = 1/T = 1/\text{period}$$

#64 Banked Circular Tracks

$$v^2 = r \cdot g \cdot \tan \theta$$

#66 First Law of Thermodynamics

$$\Delta U = Q_{\text{Net}} + W_{\text{Net}}$$
 Change in Internal Energy of a system =
 +Net Heat added to the system
 +Net Work done on the system

Flow of Heat through a Solid

$$\Delta Q / \Delta t = k \cdot A \cdot \Delta T / L$$

$$k = \text{thermal conductivity}$$

$$A = \text{area of solid}$$

$$L = \text{thickness of solid}$$

#68 Potential Energy stored in a Capacitor

$$P = \frac{1}{2} \cdot C \cdot V^2$$

RC Circuit formula (Charging)

$$V_c = V_{\text{cell}} \cdot (1 - e^{-t/RC})$$

$$R \cdot C = \tau = \text{time constant}$$

$$V_{\text{cell}} - V_{\text{capacitor}} = I \cdot R = 0$$

#71 Simple Pendulum

$$T = 2\pi \sqrt{\frac{L}{g}} \quad \text{and } f = 1/T$$

#72 Sinusoidal motion

$$x = A \cdot \cos(\omega \cdot t) = A \cdot \cos(2\pi \cdot f \cdot t)$$

$$\omega = \text{angular frequency}$$

$$f = \text{frequency}$$

#73 Doppler Effect

$$f' = f \frac{343 \pm \text{Toward } v_o}{343 \mp \text{Toward } v_s}$$

$$v_o = \text{velocity of observer}; v_s = \text{velocity of source}$$

#74 2nd Law of Thermodynamics
 The change in internal energy of a system is

$$\Delta U = Q_{\text{Added}} + W_{\text{Done On}} - Q_{\text{lost}} - W_{\text{Done By}}$$
Maximum Efficiency of a Heat Engine (Carnot Cycle) (Temperatures in Kelvin)

$$\% \text{ Eff} = \left(1 - \frac{T_c}{T_h}\right) \cdot 100\%$$

#75 Thin Lens Equation

$$\frac{1}{f} = \frac{1}{D_o} + \frac{1}{D_i} = \frac{1}{o} + \frac{1}{i}$$

$$f = \text{focal length}$$

$$i = \text{image distance}$$

$$o = \text{object distance}$$

Magnification

$$M = \Delta D_i / D_o = \Delta i / o = H_i / H_o$$

Helpful reminders for mirrors and lenses

Focal Length of:	positive	negative
mirror	concave	convex
lens	converging	diverging
Object distance = o	all objects	
Object height = H _o	all objects	
Image distance = i	real	virtual
Image height = H _i	virtual, upright	real, inverted
Magnification	virtual, upright	real, inverted

#76 Coulomb's Law

$$F = k \frac{q_1 q_2}{r^2}$$

$$k = \frac{1}{4\pi \epsilon_0} = 9E9 \frac{N \cdot m^2}{C^2}$$

#77 Capacitor Combinations
PARALLEL

$$C_{\text{eq}} = C_1 + C_2 + C_3 + \dots$$
SERIES

$$\frac{1}{C_{\text{eq}}} = \frac{1}{C_1} + \frac{1}{C_2} + \dots + \frac{1}{C_n} = \sum \frac{1}{C_i}$$

#78 Work done on a gas or by a gas

$$W = P \cdot \Delta V$$

#80 Electric Field around a point charge

$$E = k \frac{q}{r^2}$$

$$k = \frac{1}{4\pi \epsilon_0} = 9E9 \frac{N \cdot m^2}{C^2}$$

#82 Magnetic Field around a wire

$$\frac{\propto I}{2\pi r}$$
Magnetic Flux

$$\Phi = B \cdot A \cdot \cos \theta$$

Force caused by a magnetic field on a moving charge

$$F = q \cdot v \cdot B \cdot \sin \theta$$

#83 Entropy change at constant T

$$\Delta S = Q / T$$
 (Phase changes only: melting, boiling, freezing, etc)

Reference Guide & Formula Sheet for Physics

Page 4 of 8

#84 Capacitance of a Capacitor

$$C = \epsilon \cdot \sum_0 \cdot A / d$$

ϵ = dielectric constant
 A = area of plates
 d = distance between plates
 $\sum_0 = 8.85 \text{ E}(-12) \text{ F/m}$

#85 Induced Voltage

N = # of loops

$$\text{Emf} = N \frac{\Delta \Phi}{\Delta t}$$

Lenz's Law – induced current flows to create a B-field opposing the change in magnetic flux.

#86 Inductors during an increase in current

$$V_L = V_{\text{cell}} \cdot e^{-\Delta t / (L/R)}$$

$$I = (V_{\text{cell}}/R) \cdot [1 - e^{-\Delta t / (L/R)}]$$

$L/R = \tau$ = time constant

#88 Transformers

$$N_1 / N_2 = V_1 / V_2$$

$$I_1 \cdot V_1 = I_2 \cdot V_2$$

#89 Decibel Scale

$$B \text{ (Decibel level of sound)} = 10 \log (I / I_0)$$

I = intensity of sound
 I₀ = intensity of softest audible sound

#92 Poiseuille's Law

$$\Delta P = 8 \eta \cdot L \cdot Q / (\pi \cdot r^4)$$

η = coefficient of viscosity
 L = length of pipe
 r = radius of pipe
 Q = flow rate of fluid

Stress and Strain

Y or **S** or **B** = stress / strain
 stress = F/A

Three kinds of strain: unit-less ratios

- I. **Linear:** strain = $\Delta L / L$
- II. **Shear:** strain = $\Delta x / L$
- III. **Volume:** strain = $\Delta V / V$

#93 Postulates of Special Relativity

1. Absolute, uniform motion cannot be detected.
2. No energy or mass transfer can occur at speeds faster than the speed of light.

#94 Lorentz Transformation Factor

$$\gamma = \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}}$$

#95 Relativistic Time Dilation

$$\Delta t = \Delta t_0 / \gamma$$

#96 Relativistic Length Contraction

$$\Delta x = \Delta x_0 / \gamma$$

Relativistic Mass Increase

$$m = m_0 \gamma$$

#97 Energy of a Photon or a Particle

$$E = h \cdot f = m \cdot c^2$$

h = Planck's constant = 6.63 E(-34) J sec

f = frequency of the photon

#98 Radioactive Decay Rate Law

$$A = A_0 \cdot e^{-k \cdot t} = (1/2)^n \cdot A_0 \quad (\text{after } n \text{ half-lives})$$

Where k = (ln 2) / half-life

#99 Blackbody Radiation and the Photoelectric Effect

E = n · h · f where h = Planck's constant

#100 Early Quantum Physics

Rutherford-Bohr Hydrogen-like Atoms

$$r_n = R \cdot \left\{ \frac{1}{n_s^2} - \frac{1}{n^2} \right\} \text{ meters}^2$$

or

$$f = \frac{c}{\lambda} = cR \cdot \left\{ \frac{1}{n_s^2} - \frac{1}{n^2} \right\} \text{ Hz}$$

R = Rydberg's Constant
 = 1.097373143 E7 m⁻¹

n_s = series integer (2 = Balmer)

n = an integer > n_s

Mass-Energy Equivalence

$$m_v = m_0 / \gamma$$

Total Energy = KE + m₀c² = m₀c² /

Ⓢ Usually written simply as E = m₀c²

de Broglie Matter Waves

For light: E_p = h · f = h · c / λ = p · c

Therefore, momentum: p = h / λ

Similarly for particles, p = m · v = h / λ,

so the matter wave's wavelength must be

$$\lambda = h / m \cdot v$$

Energy Released by Nuclear Fission or Fusion Reaction

$$E = \Delta m_0 \cdot c^2$$

Reference Guide & Formula Sheet for Physics

MISCELLANEOUS FORMULAS

Quadratic Formula
if $ax^2 + bx + c = 0$

then

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Trigonometric Definitions

$\sin \theta = \text{opposite} / \text{hypotenuse}$

$\cos \theta = \text{adjacent} / \text{hypotenuse}$

$\tan \theta = \text{opposite} / \text{adjacent}$

$\sec \theta = 1 / \cos \theta = \text{hyp} / \text{adj}$

$\csc \theta = 1 / \sin \theta = \text{hyp} / \text{opp}$

$\cot \theta = 1 / \tan \theta = \text{adj} / \text{opp}$

Inverse Trigonometric Definitions

$\theta = \sin^{-1}(\text{opp} / \text{hyp})$

$\theta = \cos^{-1}(\text{adj} / \text{hyp})$

$\theta = \tan^{-1}(\text{opp} / \text{adj})$

Law of Sines

$a / \sin A = b / \sin B = c / \sin C$

or

$\sin A / a = \sin B / b = \sin C / c$

Law of Cosines

$a^2 = b^2 + c^2 - 2bc \cos A$

$b^2 = c^2 + a^2 - 2ca \cos B$

$c^2 = a^2 + b^2 - 2ab \cos C$

T-Pots

For the functional form

$$\frac{1}{A} = \frac{1}{B} + \frac{1}{C}$$

You may use "The Product over the Sum" rule.

$$A = \frac{B \cdot C}{B + C}$$

For the Alternate Functional form

$$\frac{1}{A} = \frac{1}{B} \cdot \frac{1}{C}$$

You may substitute T-Pot-d

$$A = \frac{B \cdot C}{C \cdot B} = \frac{B \cdot C}{B \cdot C}$$

Derivatives of Polynomials

For polynomials, with individual terms of the form Ax^n , we define the derivative of each term as

$$\frac{d}{dx}(Ax^n) = nAx^{n-1}$$

To find the derivative of the polynomial, simply add the derivatives for the individual terms:

$$\frac{d}{dx}(3x^2 + 6x + 3) = 6x + 6$$

Integrals of Polynomials

For polynomials, with individual terms of the form Ax^n , we define the indefinite integral of each term as

$$\int Ax^n dx = \frac{1}{n+1} Ax^{n+1}$$

To find the indefinite integral of the polynomial, simply add the integrals for the individual terms and the constant of integration, C.

$$\int (6x + 6) dx = [3x^2 + 6x + C]$$

Prefixes

Factor	Prefix	Symbol	Example
10 ¹⁸	exa-	E	38 Es (Age of the Universe in Seconds)
10 ¹⁵	peta-	P	
10 ¹²	tera-	T	0.3 TW (Peak power of a 1 ps pulse from a typical Nd-glass laser)

Reference Guide & Formula Sheet for Physics

Linear Equivalent Mass

Rotating systems can be handled using the linear forms of the equations of motion. To do so, however, you must use a mass equivalent to the mass of a non-rotating object. We call this the Linear Equivalent Mass (LEM). (See Example I)

For objects that are both rotating and moving linearly, you must include them twice; once as a linearly moving object (using m) and once more as a rotating object (using LEM). (See Example II)

The LEM of a rotating mass is easily defined in terms of its moment of inertia, I .

$$\text{LEM} = I/r^2$$

For example, using a standard table of Moments of Inertia, we can calculate the LEM of simple objects rotating on axes through their centers of mass:

	<u>I</u>	<u>LEM</u>
Cylindrical hoop	mr^2	m
Solid disk	$\frac{1}{2}mr^2$	$\frac{1}{2}m$
Hollow sphere	$\frac{2}{5}mr^2$	$\frac{2}{5}m$
Solid sphere	$\frac{2}{5}mr^2$	$\frac{2}{5}m$

Example I

A flywheel, $M = 4.80$ kg and $r = 0.44$ m, is wrapped with a string. A hanging mass, m , is attached to the end of the string.

When the hanging mass is released, it accelerates downward at 1.00 m/s^2 . Find the hanging mass.

To handle this problem using the linear form of Newton's Second Law of Motion, all we have to do is use the LEM of the flywheel. We will assume, here, that it can be treated as a uniform solid disk.

The only external force on this system is the weight of the hanging mass. The mass of the system consists of the hanging mass plus the linear equivalent mass of the fly-wheel. From Newton's 2nd Law we have

$$F = ma, \text{ therefore, } mg = [m + (\text{LEM} = \frac{1}{2}M)]a$$

$$mg = [m + \frac{1}{2}M] a$$

$$(mg - ma) = \frac{1}{2}M a$$

$$m(g - a) = \frac{1}{2}Ma$$

$$m = \frac{1}{2} \cdot M \cdot a / (g - a)$$

$$m = \frac{1}{2} \cdot 4.8 \cdot 1.00 / (9.81 - 1)$$

$$m = 0.27 \text{ kg}$$

If $a = g/2 = 4.905 \text{ m/s}^2$, $m = 2.4 \text{ kg}$

If $a = \frac{3}{4}g = 7.3575 \text{ m/s}^2$, $m = 7.2 \text{ kg}$

Note, too, that we do not need to know the radius unless the angular acceleration of the fly-wheel is requested. If you need α , and you have r , then $\alpha = a/r$.

Example II

Find the kinetic energy of a disk, $m = 6.7$ kg, that is moving at 3.2 m/s while rolling without slipping along a flat, horizontal surface. ($I_{\text{DISK}} = \frac{1}{2}mr^2$; $\text{LEM} = \frac{1}{2}m$)

The total kinetic energy consists of the linear kinetic energy, $K_L = \frac{1}{2}mv^2$, plus the rotational kinetic energy, $K_R = \frac{1}{2}I(\omega)^2 = \frac{1}{2}I(v/r)^2 = \frac{1}{2}(I/r^2)v^2 = \frac{1}{2}(\text{LEM})v^2$.

$$KE = \frac{1}{2}mv^2 + \frac{1}{2} \cdot (\text{LEM} = \frac{1}{2}m) \cdot v^2$$

$$KE = \frac{1}{2} \cdot 6.7 \cdot 3.2^2 + \frac{1}{2} \cdot (\frac{1}{2} \cdot 6.7) \cdot 3.2^2$$

$$KE = 34.304 + 17.152 = 51 \text{ J}$$

Final Note:

This method of incorporating rotating objects into the linear equations of motion works in every situation I've tried; even very complex problems. Work your problem the classic way and this way to compare the two. Once you've verified that the LEM method works for a particular type of problem, you can confidently use it for solving any other problem of the same type.
