Thus, the equation $a x+b y=12$ must be equivalent to the equation $2 x+$ $8 y=60$. Multiplying each side of $a x+b y=12$ by 5 gives $5 a x+5 b y=60$, which must be equivalent to $2 x+8 y=60$. Since the right-hand sides of $5 a x+5 b y=60$ and $2 x+8 y=60$ are the same, equating coefficients gives $5 a=2$, or $a=\frac{2}{5}$, and $5 b=8$, or $b=\frac{8}{5}$. Therefore, the value of $\frac{a}{b}=\left(\frac{2}{5}\right) \div\left(\frac{8}{5}\right)$, which is equal to $\frac{1}{4}$. Either the fraction $\frac{1}{4}$ or its equivalent decimal, .25 , may be gridded asthe correct answer.

Alternatively, since $a x+b y=12$ is equivalent to $2 x+8 y=60$, the equation $a x+b y=12$ is equal to $2 x+8 y=60$ multiplied on each side by the same constant. Since multiplying $2 x+8 y=60$ by a constant does not change the ratio of the coefficient of $x$ to the coefficient of $y$, it follows that $\frac{a}{b}=\frac{2}{8}=\frac{1}{4}$.

## Section 4: Math Test - Calculator

## QUESTION 1.

Choice C is correct. Since the musician earns $\$ 0.09$ for each download, the musician earns $0.09 d$ dollars when the song is downloaded $d$ times. Similarly, since the musician earns $\$ 0.002$ each time the song is streamed, the musician earns $0.002 s$ dollars when the song is streamed $s$ times. Therefore, the musician earns a total of $0.09 d+0.002 s$ dollars when the song is downloaded $d$ times and streamed $s$ times.

Choice A is incorrect because the earnings for each download and the earnings for time streamed are interchanged in the expression. Choices B and D are incorrect because in both answer choices, the musician will lose money when a song is either downloaded or streamed. However, the musician only earns money, not loses money, when the song is downloaded or streamed.

## QUESTION 2.

Choice B is correct. The quality control manager selects 7 lightbulbs at random for inspection out of every 400 lightbulbs produced. A quantity of 20,000 lightbulbs is equal to $\frac{20,000}{400}=50$ batches of 400 lightbulbs. Therefore, at the rate of 7 lightbulbs per 400 lightbulbs produced, the quality control manager will inspect a total of $50 \times 7=350$ lightbulbs.

Choices A, C, and D are incorrect and may result from calculation errors or misunderstanding of the proportional relationship.

## QUESTION 3.

Choice $\mathbf{A}$ is correct. The value of $m$ when $\ell$ is 73 can be found by substituting the 73 for $\ell$ in $\ell=24+3.5 m$ and then solving for $m$. The resulting equation is $73=24+3.5 m$; subtracting 24 from each side gives $49=3.5 m$. Then, dividing each side of $49=3.5 m$ by 3.5 gives $14=m$. Therefore, when $\ell$ is $73, m$ is 14 .

Choice B is incorrect and may result from adding 24 to 73 , instead of subtracting 24 from 73 , when solving $73=24+3.5 m$. Choice C is incorrect because 73 is the given value for $\ell$, not for $m$. Choice D is incorrect and may result from substituting 73 for $m$, instead of for $\ell$, in the equation $\ell=24+3.5 \mathrm{~m}$.

## QUESTION 4.

Choice C is correct. The amount of money the performer earns is directly proportional to the number of people who attend the performance. Thus, by the definition of direct proportionality, $M=k P$, where $M$ is the amount of money the performer earns, in dollars, $P$ is the number of people who attend the performance, and $k$ is a constant. Since the performer earns $\$ 120$ when 8 people attend the performance, one can substitute 120 for $M$ and 8 for $P$, giving $120=8 k$. Hence, $k=15$, and the relationship between the number of people who attend the performance and the amount of money, in dollars, the performer earns is $M=15 P$. Therefore, when 20 people attend the performance, the performer earns $15(20)=300$ dollars.

Choices A, B, and D are incorrect and may result from either misconceptions about proportional relationships or computational errors.

## QUESTION 5.

Choice C is correct. If $43 \%$ of the money earned is used to pay for costs, then the rest, $57 \%$, is profit. A performance where 8 people attend earns the performer $\$ 120$, and $57 \%$ of $\$ 120$ is $\$ 120 \times 0.57=\$ 68.40$.

Choice A is incorrect. The amount $\$ 51.60$ is $43 \%$ of the money earned from a performance where 8 people attend, which is the cost of putting on the performance, not the profit from the performance. Choice $B$ is incorrect. It is given that $57 \%$ of the money earned is profit, but $57 \%$ of $\$ 120$ is not equal to $\$ 57.00$. Choice D is incorrect. The profit can be found by subtracting $43 \%$ of $\$ 120$ from $\$ 120$, but $43 \%$ of $\$ 120$ is $\$ 51.60$, not $\$ 43.00$. Thus, the profit is $\$ 120-\$ 51.60=\$ 68.40$, not $\$ 120-\$ 43.00=\$ 77.00$.

## QUESTION 6.

Choice $\mathbf{B}$ is correct. When 4 times the number $x$ is added to 12 , the result is $12+4 x$. Since this result is equal to 8 , the equation $12+4 x=8$ must be true. Subtracting 12 from each side of $12+4 x=8$ gives $4 x=-4$, and then dividing both sides of $4 x=-4$ by 4 gives $x=-1$. Therefore, 2 times $x$ added to 7 , or $7+2 x$, is equal to $7+2(-1)=5$.

Choice A is incorrect because -1 is the value of $x$, not the value of $7+2 x$. Choices C and D are incorrect and may result from calculation errors.

## QUESTION 7.

Choice $\mathbf{D}$ is correct. The $x$-intercepts of the parabola represented by $y=x^{2}-6 x+8$ in the $x y$-plane are the values of $x$ for which $y$ is equal to 0 . The factored form of the equation, $y=(x-2)(x-4)$, shows that $y$ equals 0 if and only if $x=2$ or $x=4$. Thus, the factored form, $y=(x-2)(x-4)$, displays the $x$-intercepts of the parabola as the constants 2 and 4 .

Choices A, B, and C are incorrect because none of these forms shows the $x$-intercepts 2 and 4 as constants or coefficients.

## QUESTION 8.

Choice $\mathbf{D}$ is correct. Since a player starts with $k$ points and loses 2 points each time a task is not completed, the player's score will be $k-2 n$ after $n$ tasks are not completed (and no additional points are gained). Since a player who fails to complete 100 tasks has a score of 200 points, the equation $200=k-100(2)$ must be true. This equation can be solved by adding 200 to each side, giving $k=400$.

Choices A, B, and C are incorrect and may result from errors in setting up or solving the equation relating the player's score to the number of tasks the player fails to complete. For example, choice A may result from subtracting 200 from the left-hand side of $200=k-100(2)$ and adding 200 to the righthand side.

## QUESTION 9.

Choice A is correct. Since $x$ is the number of 40 -pound boxes, $40 x$ is the total weight, in pounds, of the 40-pound boxes; and since $y$ is the number of 65 -pound boxes, $65 y$ is the total weight, in pounds, of the 65 -pound boxes. The combined weight of the boxes is therefore $40 x+65 y$, and the total number of boxes is $x+y$. Since the forklift can carry up to 45 boxes or up to 2,400 pounds, the inequalities that represent these relationships are $40 x+65 y \leq 2,400$ and $x+y \leq 45$.

Choice B is incorrect. The second inequality correctly represents the maximum number of boxes on the forklift, but the first inequality divides, rather than multiplies, the number of boxes by their respective weights. Choice C is incorrect. The combined weight of the boxes, $40 x+65 y$, must be less than or equal to 2,400 pounds, not 45 ; the total number of boxes, $x+y$, must be less than or equal to 45 , not 2,400 . Choice D is incorrect. The second inequality correctly represents the maximum weight, in pounds, of the boxes on the forklift, but the total number of boxes, $x+y$, must be less than or equal to 45 , not 2,400.

## QUESTION 10.

Choice B is correct. It is given that $g(3)=2$. Therefore, to find the value of $f(g(3))$, substitute 2 for $g(3): f(g(3))=f(2)=3$.

Choices A, C, and D are incorrect and may result from misunderstandings about function notation.

## QUESTION 11.

Choice B is correct. Tony reads 250 words per minute, and he plans to read for 3 hours, which is 180 minutes, each day. Thus, Tony is planning to read $250 \times 180=45,000$ words of the novel per day. Since the novel has 349,168 words, it will take Tony $\frac{349,168}{45,000} \approx 7.76$ days of reading to finish the novel. That is, it will take Tony 7 full days of reading and most of an 8th day of reading to finish the novel. Therefore, it will take Tony 8 days to finish the novel.

Choice A is incorrect and may result from an incorrect calculation or incorrectly using the numbers provided in the table. Choice C is incorrect and may result from taking the total number of words in the novel divided by the rate Tony reads per hour. Choice $D$ is incorrect and may result from taking the total number of words in the novel divided by the number of pages in the novel.

## OUESTION 12.

Choice D is correct. Since there were 175,000 tons of trash in the landfill on January 1, 2000, and the amount of trash in the landfill increased by 7,500 tons each year after that date, the amount of trash, in tons, in the landfill $y$ years after January 1, 2000 can be expressed as $175,000+7,500 y$. The landfill has a capacity of 325,000 tons. Therefore, the set of years where the amount of trash in the landfill is at (equal to) or above (greater than) capacity is described by the inequality $175,000+7,500 y \geq 325,000$.

Choice A is incorrect. This inequality does not account for the 175,000 tons of trash in the landfill on January 1, 2000, nor does it accurately account for the 7,500 tons of trash that are added to the landfill each year after January 1, 2000. Choice B is incorrect. This inequality does not account for the 175,000 tons of trash in the landfill on January 1,2000 . Choice C is incorrect. This inequality represents the set of years where the amount of trash in the landfill is at or below capacity.

## QUESTION 13.

Choice D is correct. Survey research is an efficient way to estimate the preferences of a large population. In order to reliably generalize the results of survey research to a larger population, the participants should be randomly selected from all people in that population. Since this survey was conducted
with a population that was not randomly selected, the results are not reliably representative of all people in the town. Therefore, of the given factors, where the survey was given makes it least likely that a reliable conclusion can be drawn about the sports-watching preferences of all people in the town.

Choice A is incorrect. In general, larger sample sizes are preferred over smaller sample sizes. However, a sample size of 117 people would have allowed a reliable conclusion about the population if the participants had been selected at random. Choice B is incorrect. Whether the population is large or small, a large enough sample taken from the population is reliably generalizable if the participants are selected at random from that population. Thus, a reliable conclusion could have been drawn about the population if the 117 survey participants had been selected at random. Choice C is incorrect. When giving a survey, participants are not forced to respond. Even though some people refused to respond, a reliable conclusion could have been drawn about the population if the participants had been selected at random.

## QUESTION 14.

Choice C is correct. According to the graph, the horizontal line that represents 550 billion miles traveled intersects the line of best fit at a point whose horizontal coordinate is between 2000 and 2005, and slightly closer to 2005 than to 2000. Therefore, of the choices given, 2003 best approximates the year in which the number of miles traveled by air passengers in Country X was estimated to be 550 billion.

Choice A is incorrect. According to the line of best fit, in 1997 the estimated number of miles traveled by air passengers in Country X was about 450 billion, not 550 billion. Choice B is incorrect. According to the line of best fit, in 2000 the estimated number of miles traveled by air passengers in Country X was about 500 billion, not 550 billion. Choice D is incorrect. According to the line of best fit, in 2008 the estimated number of miles traveled by air passengers in Country X was about 600 billion, not 550 billion.

## QUESTION 15.

Choice A is correct. The number of miles Earth travels in its one-year orbit of the Sun is $580,000,000$. Because there are about 365 days per year, the number of miles Earth travels per day is $\frac{580,000,000}{365} \approx 1,589,041$. There are 24 hours in one day, so Earth travels at $\frac{1,589,041}{24} \approx 66,210$ miles per hour. Therefore, of the choices given, 66,000 miles per hour is closest to the average speed of Earth as it orbits the Sun.

Choices B, C, and D are incorrect and may result from calculation errors.

## OUESTION 16.

Choice B is correct. According to the table, there are $18+7=25$ graduates who passed the bar exam, and 7 of them did not take the review course. Therefore, if one of the surveyed graduates who passed the bar exam is chosen at random, the probability that the person chosen did not take the review course is $\frac{7}{25}$.
Choices A, C, and D are incorrect. Each of these choices represents a different probability from the conditional probability that the question asks for. Choice A represents the following probability. If one of the surveyed graduates who passed the bar exam is chosen at random, the probability that the person chosen did take the review course is $\frac{18}{25}$. Choice C represents the following probability. If one of the surveyed graduates is chosen at random, the probability that the person chosen passed the bar exam is $\frac{25}{200}$. Choice D represents the following probability. If one of the surveyed graduates is chosen at random, the probability that the person chosen passed the exam and took the review course is $\frac{7}{200}$.

## OUESTION 17.

Choice C is correct. To find the atomic weight of an unknown element that is $20 \%$ less than the atomic weight of calcium, multiply the atomic weight, in amu, of calcium by $(1-0.20):(40)(1-0.20)=(40)(0.8)=32$.

Choice A is incorrect. This value is $20 \%$ of the atomic weight of calcium, not an atomic weight $20 \%$ less than that atomic weight of calcium. Choice B is incorrect. This value is 20 amu less, not $20 \%$ less, than the atomic weight of calcium. Choice D is incorrect. This value is $20 \%$ more, not $20 \%$ less, than the atomic weight of calcium.

## QUESTION 18.

Choice C is correct. The mean and median values of a data set are equal when there is a symmetrical distribution. For example, a normal distribution is symmetrical. If the mean and the median values are not equal, then the distribution is not symmetrical. Outliers are a small group of values that are significantly smaller or larger than the other values in the data. When there are outliers in the data, the mean will be pulled in their direction (either smaller or larger) while the median remains the same. The example in the question has a mean that is larger than the median, and so an appropriate conjecture is that large outliers are present in the data; that is, that there are a few homes that are valued much more than the rest.

Choice A is incorrect because a set of home values that are close to each other will have median and mean values that are also close to each other.

Choice B is incorrect because outliers with small values will tend to make the mean lower than the median. Choice D is incorrect because a set of data where many homes are valued between $\$ 125,000$ and $\$ 165,000$ will likely have both a mean and a median between $\$ 125,000$ and $\$ 165,000$.

## QUESTION 19.

Choice B is correct. The median of a data set is the middle value when the data points are sorted in either ascending or descending order. There are a total of 600 data points provided, so the median will be the average of the 300th and 301 st data points. When the data points are sorted in order:

- Values 1 through 260 will be 0 .
- Values 261 through 450 will be 1.
- Values 451 through 540 will be 2.
- Values 541 through 580 will be 3 .
- Values 581 through 600 will be 4 .

Therefore, both the 300th and 301st values are 1 , and hence the median is 1 .
Choices A, C, and D are incorrect and may result from either a calculation error or a conceptual error.

## QUESTION 20.

Choice C is correct. When survey participants are selected at random from a larger population, the sample statistics calculated from the survey can be generalized to the larger population. Since 10 of 300 students surveyed at Lincoln School have 4 siblings, one can estimate that this same ratio holds for all 2,400 students at Lincoln School. Also, since 10 of 300 students surveyed at Washington School have 4 siblings, one can estimate that this same ratio holds for all 3,300 students at Washington School. Therefore, approximately $\frac{10}{30} \times 2,400=80$ students at Lincoln School and $\frac{10}{30} \times 3,300=110$ students at Washington School are expected to have 4 siblings. Thus, the total number of students with 4 siblings at Washington School is expected to be $110-80=30$ more than the total number of students with 4 siblings at Lincoln School.

Choices A, B, and D are incorrect and may result from either conceptual or calculation errors. For example, choice A is incorrect; even though there is the same ratio of survey participants from Lincoln School and Washington School with 4 siblings, the two schools have a different total number of students, and thus, a different expected total number of students with 4 siblings.

## QUESTION 21.

Choice $\mathbf{D}$ is correct. The difference between the number of hours the project takes, $y$, and the number of hours the project was estimated to take, $x$, is $|y-x|$. If the goal is met, the difference is less than 10 , which can be represented as $|y-x|<10$ or $-10<y-x<10$.

Choice A is incorrect. This inequality states that the estimated number of hours plus the actual number of hours is less than 10 , which cannot be true because the estimate is greater than 100. Choice B is incorrect. This inequality states that the actual number of hours is greater than the estimated number of hours plus 10 , which could be true only if the goal of being within 10 hours of the estimate were not met. Choice C is incorrect. This inequality states that the actual number of hours is less than the estimated number of hours minus 10 , which could be true only if the goal of being within 10 hours of the estimate were not met.

## QUESTION 22.

Choice B is correct. To rearrange the formula $I=\frac{P}{4 \pi r^{2}}$ in terms of $r^{2}$, first multiply each side of the equation by $r^{2}$. This yields $r^{2} I=\frac{P}{4 \pi}$. Then dividing each side of $r^{2} I=\frac{P}{4 \pi}$ by $I$ gives $r^{2}=\frac{P}{4 \pi} I$.
Choices A, C, and D are incorrect and may result from algebraic errors during the rearrangement of the formula.

## QUESTION 23.

Choice $\mathbf{A}$ is correct. If $I_{\mathrm{A}}$ is the intensity measured by Observer A from a distance of $r_{\mathrm{A}}$ and $I_{\mathrm{B}}$ is the intensity measured by Observer B from a distance of $r_{\mathrm{B}}$, then $I_{\mathrm{A}}=16 I_{\mathrm{B}}$. Using the formula $I=\frac{P}{4 \pi^{2}}$, the intensity measured by Observer A is $I_{\mathrm{A}}=\frac{P}{4 \pi r_{\mathrm{A}}{ }^{2}}$, which can also be written in terms of $I_{\mathrm{B}}$ as $I_{\mathrm{A}}=16 I_{\mathrm{B}}=16\left(\frac{P}{4 \pi r_{\mathrm{B}}{ }^{2}}\right)$. Setting the right-hand sides of these two equations equal to each other gives $\frac{P}{4 \pi r_{\mathrm{A}}{ }^{2}}=16\left(\frac{P}{4 \pi r_{\mathrm{B}}{ }^{2}}\right)$, which relates the distance of Observer A from the radio antenna to the distance of Observer B from the radio antenna. Canceling the common factor $\frac{P}{4 \pi}$ and rearranging the equation gives $r_{\mathrm{B}}{ }^{2}=16 r_{\mathrm{A}}{ }^{2}$. Taking the square root of each side of $r_{\mathrm{B}}{ }^{2}=16 r_{\mathrm{A}}{ }^{2}$ gives $r_{\mathrm{B}}=4 r_{\mathrm{A}^{\prime}}$, and then dividing each side by 4 yields $r_{\mathrm{A}}=\frac{1}{4} r_{\mathrm{B}}$. Therefore, the distance of Observer A from the radio antenna is $\frac{1}{4}$ the distance of Observer B from the radio antenna.

Choices B, C, and D are incorrect and may result from errors in deriving or using the formula $\frac{P}{4 \pi r_{\mathrm{A}}{ }^{2}}=(16)\left(\frac{P}{4 \pi r_{\mathrm{B}}{ }^{2}}\right)$.

## QUESTION 24.

Choice A is correct. The equation of a circle with center $(h, k)$ and radius $r$ is $(x-h)^{2}+(y-k)^{2}=r^{2}$. To put the equation $x^{2}+y^{2}+4 x-2 y=-1$ in this form, complete the square as follows:

$$
\begin{aligned}
x^{2}+y^{2}+4 x-2 y & =-1 \\
\left(x^{2}+4 x\right)+\left(y^{2}-2 y\right) & =-1 \\
\left(x^{2}+4 x+4\right)-4+\left(y^{2}-2 y+1\right)-1 & =-1 \\
(x+2)^{2}+(y-1)^{2}-4-1 & =-1 \\
(x+2)^{2}+(y-1)^{2} & =4=2^{2}
\end{aligned}
$$

Therefore, the radius of the circle is 2 .
Choice C is incorrect because it is the square of the radius, not the radius. Choices B and D are incorrect and may result from errors in rewriting the given equation in standard form.

## QUESTION 25.

Choice A is correct. In the $x y$-plane, the slope $m$ of the line that passes through the points $\left(x_{1}, y_{1}\right)$ and $\left(x_{2}, y_{2}\right)$ is given by the formula $m=\frac{y_{2}-y_{1}}{x_{2}-x_{1}}$. Thus, if the graph of the linear function $f$ has intercepts at $(a, 0)$ and $(0, b)$, then the slope of the line that is the graph of $y=f(x)$ is $m=\frac{0-b}{a-0}=-\frac{b}{a}$. It is given that $a+b=0$, and so $a=-b$. Finally, substituting $-b$ for $a$ in $m=-\frac{b}{a}$ gives $m=-\frac{b}{-b}=1$, which is positive.
Choices B, C, and D are incorrect and may result from a conceptual misunderstanding or a calculation error.

## QUESTION 26.

Choice $\mathbf{D}$ is correct. The definition of the graph of a function $f$ in the $x y$ plane is the set of all points $(x, f(x))$. Thus, for $-4 \leq a \leq 4$, the value of $f(a)$ is 1 if and only if the unique point on the graph of $f$ with $x$-coordinate $a$ has $y$-coordinate equal to 1 . The points on the graph of $f$ with $x$-coordinates $-4, \frac{3}{2}$, and 3 are, respectively, $(-4,1),\left(\frac{3}{2}, 1\right)$, and $(3,1)$. Therefore, all of the values of $f$ given in I, II, and III are equal to 1 .

Choices $\mathrm{A}, \mathrm{B}$, and C are incorrect because they each omit at least one value of $x$ for which $f(x)=1$.

## QUESTION 27.

Choice $\mathbf{D}$ is correct. According to the graph, in the interval from 0 to 10 minutes, the non-insulated sample decreased in temperature by about $18^{\circ} \mathrm{C}$, while the insulated sample decreased by about $8^{\circ} \mathrm{C}$; in the interval from 10 to 20 minutes, the non-insulated sample decreased in temperature by about $9^{\circ} \mathrm{C}$, while the insulated sample decreased by about $5^{\circ} \mathrm{C}$; in the interval
from 40 to 50 minutes, the non-insulated sample decreased in temperature by about $1^{\circ} \mathrm{C}$, while the insulated sample decreased by about $3^{\circ} \mathrm{C}$; and in the interval from 50 to 60 minutes, the non-insulated sample decreased in temperature by about $1^{\circ} \mathrm{C}$, while the insulated sample decreased by about $2^{\circ} \mathrm{C}$. The description in choice D accurately summarizes these rates of temperature change over the given intervals. (Note that since the two samples of water have equal mass and so must lose the same amount of heat to cool from $60^{\circ} \mathrm{C}$ to $25^{\circ} \mathrm{C}$, the faster cooling of the non-insulated sample at the start of the cooling process must be balanced out by faster cooling of the insulated sample at the end of the cooling process.)

Choices A, B, and C are incorrect. None of these descriptions accurately compares the rates of temperature change shown in the graph for the 10 -minute intervals.

## QUESTION 28.

Choice B is correct. In the $x y$-plane, the slope $m$ of the line that passes through the points $\left(x_{1}, y_{1}\right)$ and $\left(x_{2}, y_{2}\right)$ is $m=\frac{y_{2}-y_{1}}{x_{2}-x_{1}}$. Thus, the slope of the line through the points $C(7,2)$ and $E(1,0)$ is $\frac{2-0}{7-1}$, which simplifies to $\frac{2}{6}=\frac{1}{3}$. Therefore, diagonal $A C$ has a slope of $\frac{1}{3}$. The other diagonal of the square is a segment of the line that passes through points $B$ and $D$. The diagonals of a square are perpendicular, and so the product of the slopes of the diagonals is equal to -1 . Thus, the slope of the line that passes through $B$ and $D$ is -3 because $\frac{1}{3}(-3)=-1$. Hence, an equation of the line that passes through $B$ and $D$ can be written as $y=-3 x+b$, where $b$ is the $y$-intercept of the line. Since diagonal $B D$ will pass through the center of the square, $E(1,0)$, the equation $0=-3(1)+b$ holds. Solving this equation for $b$ gives $b=3$. Therefore, an equation of the line that passes through points $B$ and $D$ is $y=-3 x+3$, which can be rewritten as $y=-3(x-1)$.

Choices A, C, and D are incorrect and may result from a conceptual error or a calculation error.

## OUESTION 29.

Choice $\mathbf{B}$ is correct. Substituting 3 for $y$ in $y=a x^{2}+b$ gives $3=a x^{2}+b$, which can be rewritten as $3-b=a x^{2}$. Since $y=3$ is one of the equations in the given system, any solution $x$ of $3-b=a x^{2}$ corresponds to the solution $(x, 3)$ of the given system. Since the square of a real number is always nonnegative, and a positive number has two square roots, the equation $3-b=a x^{2}$ will have two solutions for $x$ if and only if (1) $a>0$ and $b<3$ or (2) $a<0$ and $b>3$. Of the values for $a$ and $b$ given in the choices, only $a=-2, b=4$ satisfy one of these pairs of conditions.

Alternatively, if $a=-2$ and $\mathrm{b}=4$, then the second equation would be $y=-2 x^{2}+4$. The graph of this quadratic equation in the $x y$-plane is a parabola with $y$-intercept $(0,4)$ that opens downward. The graph of the first equation, $y=3$, is the horizontal line that contains the point $(0,3)$. As shown below, these two graphs have two points of intersection, and therefore, this system of equations has exactly two real solutions. (Graphing shows that none of the other three choices produces a system with exactly two real solutions.)

Choices A, C, and D are incorrect and may result from calculation or conceptual errors.

## QUESTION 30.

Choice A is correct. The regular hexagon can be divided into 6 equilateral triangles of side length $a$ by drawing the six segments from the center of the regular hexagon to each of its 6 vertices. Since the area of the hexagon is $384 \sqrt{3}$ square inches, the area of each equilateral triangle will be $\frac{384 \sqrt{3}}{6}=64 \sqrt{3}$ square inches.

Drawing any altitude of an equilateral triangle divides it into two $30^{\circ}-60^{\circ}-90^{\circ}$ triangles. If the side length of the equilateral triangle is $a$, then the hypotenuse of each $30^{\circ}-60^{\circ}-90^{\circ}$ triangle is $a$, and the altitude of the equilateral triangle will be the side opposite the $60^{\circ}$ angle in each of the $30^{\circ}-60^{\circ}-90^{\circ}$ triangles. Thus, the altitude of the equilateral triangle is $\frac{\sqrt{3}}{2} a$, and the area of the equilateral triangle is $\frac{1}{2}(a)\left(\frac{\sqrt{3}}{2} a\right)=\frac{\sqrt{3}}{4} a^{2}$. Since the area of each equilateral triangle is $64 \sqrt{3}$ square inches, it follows that $a^{2}=\frac{4}{\sqrt{3}}(64 \sqrt{3})$ $=256$ square inches. And since the area of the square with side length $a$ is $a^{2}$, it follows that the square has area 256 square inches.

Choices B, C, and D are incorrect and may result from calculation or conceptual errors.

## QUESTION 31.

The correct answer is $\mathbf{1 4}$. Since the coastal geologist estimates that the country's beaches are eroding at a rate of 1.5 feet every year, they will erode by $1.5 x$ feet in $x$ years. Thus, if the beaches erode by 21 feet in $x$ years, the equation $1.5 x=21$ must hold. The value of $x$ is then $\frac{21}{1.5}=14$. Therefore, according to the geologist's estimate, it will take 14 years for the country's beaches to erode by 21 feet.

## QUESTION 32.

The correct answer is 7. There are 60 minutes in each hour, and so there are $60 h$ minutes in $h$ hours. Since $h$ hours and 30 minutes is equal to 450 minutes, it follows that $60 h+30=450$. This equation can be simplified to $60 h=420$, and so the value of $h$ is $\frac{420}{60}=7$.

## QUESTION 33.

The correct answer is 11. It is given that the function $f(x)$ passes through the point $(3,6)$. Thus, if $x=3$, the value of $f(x)$ is 6 (since the graph of $f$ in the $x y$-plane is the set of all points $(x, f(x))$. Substituting 3 for $x$ and 6 for $f(x)$ in $f(x)=3 x^{2}-b x+12$ gives $6=3(3)^{2}-b(3)+12$. Performing the operations on the right-hand side of this equation gives $6=3(9)-3 b+12=$ $27-3 b+12=39-3 b$. Subtracting 39 from each side of $6=39-3 b$ gives $-33=-3 b$, and then dividing each side of $-3 b=-33$ by -3 gives the value of $b$ as 11 .

## QUESTION 34.

The correct answer is $\mathbf{1 0 5}$. Let $D$ be the number of hours Doug spent in the tutoring lab, and let $L$ be the number of hours Laura spent in the tutoring lab. Since Doug and Laura spent a combined total of 250 hours in the tutoring lab, the equation $D+L=250$ holds. The number of hours Doug spent in the lab is 40 more than the number of hours Laura spent in the lab, and so the equation $D=L+40$ holds. Substituting $L+40$ for $D$ in $D+L=250$ gives $(L+40)+L=250$, or $40+2 L=250$. Solving this equation gives $L=105$. Therefore, Laura spent 105 hours in the tutoring lab.

## QUESTION 35.

The correct answer is 15. The amount, $a$, that Jane has deposited after $t$ fixed weekly deposits is equal to the initial deposit plus the total amount of money Jane has deposited in the $t$ fixed weekly deposits. This amount $a$ is given to be $a=18 t+15$. The amount she deposited in the $t$ fixed weekly deposits is the amount of the weekly deposit times $t$; hence, this amount must be given by the term $18 t$ in $a=18 t+15$ (and so Jane must have deposited 18 dollars each week after the initial deposit). Therefore, the amount of Jane's original deposit, in dollars, is $a-18 t=15$.

## QUESTION 36.

The correct answer is 32. Since segments $L M$ and $M N$ are tangent to the circle at points $L$ and $N$, respectively, angles OLM and ONM are right angles. Thus, in quadrilateral OLMN, the measure of angle $O$ is $360^{\circ}-\left(90^{\circ}+60^{\circ}\right.$ $\left.+90^{\circ}\right)=120^{\circ}$. Thus, in the circle, central angle $O$ cuts off $\frac{120}{360}=\frac{1}{3}$ of the circumference; that is, minor $\operatorname{arc} \overparen{L N}$ is $\frac{1}{3}$ of the circumference. Since the circumference is 96 , the length of minor $\operatorname{arc} \overparen{L N}$ is $\frac{1}{3} \times 96=32$.

## QUESTION 37.

The correct answer is 3284. According to the formula, the number of plants one year from now will be $3000+0.2(3000)\left(1-\frac{3000}{4000}\right)$, which is equal to 3150. Then, using the formula again, the number of plants two years from now will be $3150+0.2(3150)\left(1-\frac{3150}{4000}\right)$, which is 3283.875 . Rounding this value to the nearest whole number gives 3284 .

## QUESTION 38.

The correct answer is $\mathbf{7 5 0 0}$. If the number of plants is to be increased from 3000 this year to 3360 next year, then the number of plants that the environment can support, $K$, must satisfy the equation $3360=3000+$ $0.2(3000)\left(1-\frac{3000}{K}\right)$. Dividing both sides of this equation by 3000 gives $1.12=$ $1+0.2\left(1-\frac{3000}{K}\right)$, and therefore, it must be true that $0.2\left(1-\frac{3000}{K}\right)=0.12$, or equivalently, $1-\frac{3000}{K}=0.6$. It follows that $\frac{3000}{K}=0.4$, and so $K=\frac{3000}{0.4}=7500$.
